

**BMI088**  
**IMU for Accelerometer (+/-24g) and Gyroscope**

Header pins for probing and optional connection/disconnection/reconfiguration.  
Zero Ohm resistors for a default connection without needing to add the header pins.

Sheet: /IMU/

### Servo Power Delivery

Datasheet does not say anything about servo power.  
Internet has a lot of different info.  
Consensus seems to be servos stall at 650-800mA but usually operate in the 300mA or below range.  
Go with two servos per 1A LDO.  
Chances of using more than 3 servos is probably slim. Just put them on separate rails.  
There's no way this can bite me in the butt right? RIGHT!?

I've been lead to believe all servos can handle 3.3v signals  
and a level shifter is not needed. Do not populate  
the level shifter. Add later if needed and remove the 0 ohm resistor.

### Servo connections and potential level shifter

## Reaction wheel motor driver

Bulk capacitor  
10uF taken from eval board  
Add extra empty pad to try different configurations

Sheet: /reaction\_control\_wheel/  
File: reaction\_control\_wheel.kicad\_sch

## Pyro power source with resistor

Actually want raw VBATT instead of protected because don't want the diode voltage drop, and polarity doesn't matter in this case.

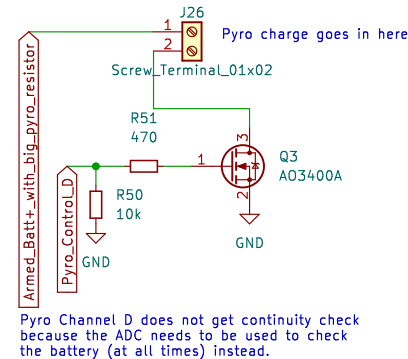

I've been told, and believe, that the Pyros fire for much less than a second and thus you can get away with small wattage (1W–5W) through hole resistors that don't meet the theoretical requirements.  
 This would make things much cheaper.  
 Leave some parallel and series configurations options open for experimentation.

## Pyro Channel A

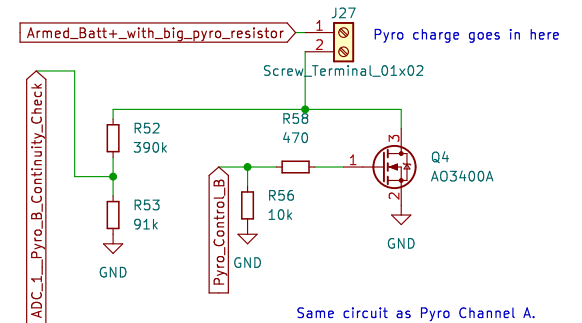

The impedance of the rp2040 adc pins are not given.  
 Hopefully it's high enough to not cause issues.  
 Should give roughly a 1/5th of the battery reading if there is continuity.  
 Back of envelope worst case scenario amperage:  $V=12$ ,  $R=400k$ ,  $I=12/400k= .0275mA$  or 27.5uA.  
 And 27.5uA should be well below what's required to set off any pyros.  
 And  $3.3v*5$  is much greater than the battery could be, so the adc should always be in range.

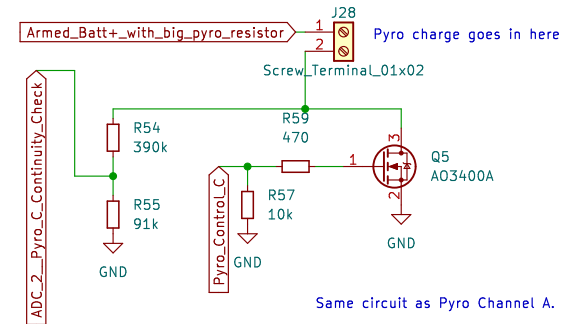

## Pyro Channel D

## Pyro Channel B

## Pyro Channel C

## Battery voltage reading circuit

General notes – Make these traces big!
